NOTE: This is a 'working draft' sequence. It currently consists of 63 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (12-JUL-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA on Jul 11, 2002 This sequence version replaced gi:18138623.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (12-JAN-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (bases 1 to 176574)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequencing vector: M13;
Chemistry: Dye-terminator Big Dye: 100% of reads

The sequence encodes a novel human lipid metabolism enzyme (LME-2) of the invention. The invention relates to novel human LME's, and the polymention. The invention relates to novel human LME's, and the invention have cytostatic, neuroprecetive, immunosuppressive, anti-inflammatory, and cardiovascular activity. The polymeptides and polymentials have a use in gene therapy and enzyme therapy. The lipid metabolism enzymes are useful in the diagnosis, treatment and prevention of cancer, neurological disorders, autoimmune/inflammatory disorders, and cardiovascular disorders, and in the assessment of the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of lipid metabolism enzymes. LMEs may also be used to screen for compounds that modulate the activity of LME. Polymuclectides encoding LME may be used for somatic or germline gene therapy, to detect and quantify gene expression in biopsied tissues in which expression of LME may be correlated with disease, to generate a transcript image of a tissue or cell type, to generate hybridization probes useful in mapping the naturally occurring genomic sequence, and for screening libraries of compounds in drug screening techniques. The polypeptide sequences may be used to analyse the proteome of a tissue or cell type. Oligonuclectide is primer and to analyse the proteome of a tissue or cell type. Oligonuclectide is primer and to analyse the proteome of a tissue or cell type. Oligonuclectide is primer and to analyse the proteome of a tissue or cell type.

The present sequence is the coding sequence of human phospholipase 1 (HPPLI). The protein produced from this sequence is involved in the hydrolysis of membrane phospholipids. The protein and its coding sequence can be used to diagnose and treat the following: cancers such as prostate, breast and testicular cancers, autoimmune and inflammatory disorders such as AIDS, allergies, ansemia, asthma, atherosclerosis, crohn's disease, diabetes mellitus, emphysema, graves, disease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, psoriasis, rhemmatoid arthritis and systemic lupus extyhematous, infection caused by viruses, fungi, bacteria, parasites and protozoa, and reproductive disorders including infertility, disruptions of the menstrual cycle,
Human phospholipase genes and proteins useful to diagnose, prevent or treat cancer, autoimmune or inflammatory or reproductive disorders
                                                                                                                                                                                                                                               Human; phospholipase 1; HPPL1; cancer; autoimmune disorder; inflammatory disorder; reproductive disorder; infection; ss.

The invention leaders to move numbed process.

The invention leaders to move them and antibodies raised against them.

The proteins, antibodies and nucleic acids are useful in the diagnosis,

The proteins, antibodies and nucleic acids are useful in the diagnosis,

Expressible processis, prevention and/or treatment or diseases and/or disorders.

The prognosis, prevention and/or treatment or diseases and/or disorders.

The prognosis, prevention and/or treatment of anorexis, cardiovascular disorders of small intestine, disorders of reproductive system.

The coronary heart disease and arteriosclerosis, anorexis, obsidery system.

The coronary heart disease, and intestine, disorders of pulmonary system.

The coronary heart disease, bone disorders of pulmonary system.

The contral nervous system disorders, disorders of pulmonary system.

The contral nervous system disorders, co. and other hyperpoliferative disorders, disease, and peaning disabilities, amyotropic lateral sclerosis, disease, autism, sleep disorders, immune system disorders, entranced and disorders, immune system disorders, contral nervous system disorders (e.g. multiple sclerosis, ischemic contral nervous system disorders (e.g. multiple sclerosis, ischemic contral nervous system disorders (e.g. multiple sclerosis, ischemic contral nervous system disorders (e.g. asthma, acquired immunodeficient syndrome contral nervous system disorders (e.g. asthma, acquired immunodeficient syndrome contral nervous system disorders (e.g. asthma, acquired immunodeficient syndrome contral nervous system disorders, infections diseases, incorders and wound disorders, respiratory disorders of lactory disorders and wound considers, respiratory disorders of encodes an NHP of the Invention.

The present invention describes human secretory phospholipase A2 (PLA2). PLA2 has antiallergic, antiinflammatory, antibacterial, tranquillser, immunosuppressive, vulnerary, antirheumatic and antiarthritic activities. Human secretory phospholipase A2 (PLA2), the gene encoding it and antibodies against it are useful for the diagnosis and treatment of secretory PLA2-associated diseases e.g. septic shock, trauma, pancreatitis, allergic rhinitis and chronic rheumatoid arthritis. The

The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, adog, cat. horse, cow, pig, hamster, monkey, macaque, veast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA

AAH99166 to AAH99904 encode the human proteins given in AAM25225 to
CAM25963. The proteins can have activities based on the tissues and
calls they are expressed in such as: antiinflammatory; antirheumatic;
calls they are expressed in such as: antiinflammatory; antirheumatic;
antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant;
cardiovascular; antianaemic; antiangemic; antidaperis; orthogram inflammatic; antibactic; orthogram; orthogram; and immunostimular; antidepressant; nootropic;
antidabetic; cytostatic; neuroprotective; antidepressant; nootropic;
antidabetic; cytostatic; neuroprotectides are useful for screening for production. The proteins and polynucleotides are useful for screening for production, The protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoiette diseases, canaematopoiette dis

The invention relates to polynucleotides encoding proteins CG122, CG179, CG CG55, CG121, CG162, CG27, CG153 and CG168 which are related to proteins involved in lipid metabolism and cardiovascular disease such as human apolioporoteins. Ilpases and lipoprotein receptor proteins. These DNA capolioporoteins, lipases and lipoprotein receptor proteins. These DNA capolioporoteins, lipases and lipoprotein receptor (ALLr) cassociated with apolioporoteins, lipases and lipoprotein receptor (ALLr) cassociated with apolioporoteins, lipases and lipoprotein receptor (ALLr) cassociated with apolioporoteins, lipases and lipoprotein receptor (ALLr) caporition and thrombosis. Antibodies against these proteins are useful for useful for identifying apents (agonists and antagonists) that bind to useful for identifying a number of a pathology related to therapeutic agent for use in treatment of a pathology related to caperrant expression or physiological interactions of this polypeptide. Vectors comprising these DNA and protein sequences are also useful for the nucleic acids and polypeptides of the invention are also useful for the treatment of occlusive cardiovascular diseases, myocardial infarction, cerebral isofamal, andina, arterial trombosis, coronary artery thrombosis and cerebral artery thrombosis of intracardiac thrombosis and stroke. The nucleotides of the invention librae DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding human apolipoproteins, lipases, and lipoprotein receptor polypeptides, useful for preventing diagnosing and treating lipid metabolism disorders, thrombosis and cardiovascular diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              u P, Goodrich R;

useful for preventing, diagnosing and treating diagnosing a modulating cardiovascular, endothelial or angiogenic disorder in mammals by and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with imappropriate PRO expression such as cardiovascular, endothelial or cardiac hypertrophy. For example, the nucleic acids (NCS) and vectors associated with decreased PRO expression and the propolypetide may be used to treat and containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAS21244-AAS21518 encode for novel human secretory and transmembrane
PRO polypeptides. The PRO polypeptides are useful to detect other
PRO polypeptides, to link bloactive molecules to cells expressing
PRO polypeptides, to modulate biological activities of cells expressing
DRO polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
DOLYPEPTIDE expression in a cell sample to that in a control sample.
Come of the 275 sequences are also useful to stimulate the release of tumour necrosis factor alpha (TNF-alpha) from human blood, the
Come of the 275 sequences are also useful to stimulate the release of condrecytes, the proliferation or differentiation of condrecytes, the proliferation of inner ear utricular supporting cells of T-lymphocytes, the release of a cytckine from peripheral blood
monocytes, the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeltal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynuclectides encoding CR PRO polypeptides can be used to generate probes, antisense RNA/DNA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                 New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100 GGGAGGAGCGCCATCCTGTCGTGGGCTACGGTTGCTACTGTGGGGTTGGGGGGCCGT 159

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A human PLA2-encoding cDNA (AAQ81138) expressing HPLA2-10, was isolated from human brain RNA by RACE-PCR. 2 Rat PLA2 cDNAs, designated RPLA2-8 (AAQ81136) and RPLA2-10 (AAQ81137), were isolated from rat brain and heart cDNA libraries, respectively. A partial human genomic counterpart to RPLA2-8, HPLA2-8 (AAQ81139), was also obtained. RPLA2-8 and HPLA2-8 have been designated type III PLA2, and RPLA2-10

A human PLA2-encoding cDNA (AAQ81138) expressing HPLA2-10, was isolated from human brain RNA by RACE-PCR. 2 Rat PLA2 cDNAS, designated RPLA2-8 (AAQ81136) and RPLA2-10 (AAQ81137), were isolated from rat brain and heart cDNA libraries, respectively. A partial human genomic counterpart to RPLA2-8, HPLA2-8 (AAQ81139), was also obtained. RPLA2-8 and HPLA2-8 have been designated type III PLA2, and RPLA2-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              181 GACTGGTGCTGCCACGCCCACGACTGCTGCTACCAGGAACTCTTTGACCAAGGCTGTCAC 240

The full length cDNA was generated using primers AAA72082-A72088 in the invention relates to the novel secreted retain phospholipase A2 activity. It also encompasses an expression retain phospholipase A2 activity. It also encompasses an expression method for the recombinant production of the protein, a method of screening potential inhibitors of the protein, a method of screening potential inhibitors of the protein, a method of a screening potential inhibitors of the protein and the compounds thus used for the diagnosis of a variety of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

The present invention describes human secretory phospholipase A2 (PLA2). PLA2 has antiallergic, antinflammatory, antibacterial, tranquillser, immunosuppressive, vulnerary, antirheumatic and antiarthritic activities. Human secretory phospholipase A2 (PLA2), the gene encoding it and antibodies against it are useful for the diagnosis and treatment pancreatitis, places of secretory PLA2-associated diseases e.g. septic shock, trauma, pancreatitis, allergic rhinitis and chronic rheumatoid arthritis. The present sequence encodes mouse PLA2, which is used in an example from
                                                                                                                                                                                          Mouse secretory phospholipase A2 nucleotide sequence SEQ ID NO:13.

Patent No. 6352849

GENERAL INFORMATION:
APPLICANT: Tischfield, Jay A.
APPLICANT: Selthamer, Jeffrey J.
TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences TITLE OF INVENTION: Encoded Thereby, Antisense Sequences and Nuclectide
TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites
